Art Unit: 2113

DETAILED ACTION

This action is in response to an amendment filed on June 22, 2007 for the application of Harper et al., for an "Automatic crash recovery in computer operating systems" filed February 28, 2004.

Claims 1-43 are pending in the application.

Claims 23-42 are rejected under 35 USC § 101.

Claims 1-10, 13-30, and 33-43 are rejected under 35 USC § 102.

Claims 11-12, and 31-32 are rejected under 35 USC § 103.

Claim Rejections - 35 USC § 101

35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

Claims 23-42 are rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter.

As per claim 23, the limitation of "an arrangement for" is directed to an arrangement of software. Computer programs claimed as computer listings per se, i.e., the descriptions or expressions of the programs are not physical "things." They are neither computer components nor statutory processes, as they are not "acts" being performed. Such claimed computer programs do not define any structural and functional interrelationships between the computer program and other claimed elements of a computer, which permit the computer program's functionality to be realized.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-10, 13-30, and 33-43 are rejected under 35 U.S.C. 102(b) as being anticipated by Klemm et al. (U.S. Patent No. 6,457,142).

As per claim 1, Klemm discloses a method of providing automatic recovery from operating system faults, said method comprising the steps of: detecting a system fault (Fig. 7, element 701) analyzing the system fault (Fig. 7, elements 702 and 703) determining a cause of the system fault (Fig. 7, elements 702 and 703) determining a solution (Fig. 7, element 704) and applying a solution (Fig. 7, element 707).

As per claim 2, Klemm discloses providing a resolution test (Fig. 7, element 701) and returning to production (Fig. 7, element 708).

As per claim 3, Klemm discloses at least one of the recited steps does not require any work (Fig. 3).

Art Unit: 2113

As per claim 4, Klemm discloses at least one of the recited steps does not require any work (Fig. 3).

As per claim 5, Klemm discloses said detecting step comprises at least one of: an operating system call to a halting routine (Fig. 7, element 701) and an exception or error associated with at least one of: an operating system, middleware, firmware and Licensed Internal Code (Fig. 7, element 701).

As per claim 6, Klemm discloses said detecting step comprises an abnormal termination of a driver or application (Fig. 4, element 406).

As per claim 7, Klemm discloses said detecting step comprises a hypervisor observation of unusual behavior from a guest operating system (Fig. 7).

As per claim 8, Klemm discloses said detecting step comprises an interception of a call to an operating system halting routine or exception handler (Fig. 7, element 701).

As per claim 9, Klemm discloses said detecting step comprises automatically inspecting at least one aspect relating to the operating system (Fig. 8)

As per claim 10, Klemm discloses said detecting step comprises automatically inspecting at least one of: main memory; a kernel stack; process stacks; a state of all

running threads; an amount of pageable memory used; an amount of pageable memory free for use; an amount of total pageable memory in the system; an amount of total pageable memory available to the operating system kernel; an amount of non-pageable memory used; an amount of Non-pageable memory free for use; an amount of total non-pageable memory in the system; an amount of total non-pageable memory available to the operating system kernel; a number of system page table entries used; a number of system page table entries available for use; an amount of virtual memory allocated to a system page table; a size of a system cache; a size of a page cache; a size of a file cache; an amount of space available in a system cache; an amount of space available in a page cache; an amount of space available in a file cache; a size of a system working set; a number of system buffers available; page sizes; a number of network connections established; utilization of one or more central processing units; a number of threads allocated; a percentage of time spent in a kernel; a number of system interrupts per unit time; a number of page faults per unit time; a number of page faults in a system cache per unit time; a number of paged pool allocations per unit time; a number of non-paged pool allocations per unit time; a length of look-aside lists; a number of open file descriptors; an amount of free space on a disk or disks; a percentage of time spent at interrupt level; a number of device drivers that are loaded; status of loaded device drivers; a number of outstanding I/O requests for device drivers; a state of devices attached to the system (Fig. 3 and 8) and (col. 5-6).

Art Unit: 2113

As per claim 13, Klemm discloses said step of automatically inspecting is performed via software (Fig. 8).

As per claim 14, Klemm discloses said step of determining a cause comprises identifying at least one faulty component (Fig. 7).

As per claim 15, Klemm discloses said analyzing step provides input into said step of determining a cause (Fig. 7, elements 703 and 704).

As per claim 16, Klemm discloses external information provides input into said step of determining a cause (Fig. 7, elements 703 and 704).

As per claim 17, Klemm discloses said step of applying a solution comprises effecting one or more changes or updates in at least one of: device driver software, operating system code, and firmware (Fig. 7, element 707).

As per claim 18, Klemm discloses said step of effecting one or more changes or updates comprises deactivating faulty software (Fig. 7, element 706).

As per claim 19, Klemm discloses said step of providing a resolution test comprises monitoring a new component during a trial period (Fig. 5).

As per claim 20, Klemm discloses the trial period is over a finite period of time (col. 4, lines 8-25).

As per claim 21, Klemm discloses the status of the new component is reported subsequent to the trial period (Fig. 5).

As per claim 22, Klemm discloses at least one of the following steps is repeated upon determination of a negative status of the new component: detecting a system fault (Fig. 7, element 701) analyzing the system fault (Fig. 7, elements 702 and 703) determining a cause of the system fault (Fig. 7, elements 702 and 703) determining a solution (Fig. 7, element 704) and applying a solution (Fig. 7, element 707) and providing a resolution test (Fig. 7, element 701).

As per claim 23, Klemm discloses an apparatus for providing automatic recovery from operating system faults, said apparatus comprising: an arrangement for detecting a system fault (Fig. 7, element 701) an arrangement for analyzing the system fault (Fig. 7, elements 702 and 703) an arrangement for determining a cause of the system fault (Fig. 7, elements 702 and 703) an arrangement for determining a solution (Fig. 7, element 704) and an arrangement for applying a solution (Fig. 7, element 707).

As per claim 24, Klemm discloses an arrangement for providing a resolution test (Fig. 7, element 701) and an arrangement for returning to production (Fig. 7, element 708).

As per claim 25, Klemm discloses said detecting arrangement is adapted to provide at least one of: an operating system call to a halting routine (Fig. 7, element 701) and an exception or error associated with at least one of: an operating system, middleware, firmware and Licensed Internal Code (Fig. 7, element 701).

As per claim 26, Klemm discloses said detecting arrangement is adapted to provide an abnormal termination of a driver or application (Fig. 4, element 406).

As per claim 27, Klemm discloses said detecting arrangement is adapted to provide a hypervisor observation of unusual behavior from a guest operating system (Fig. 7).

As per claim 28, Klemm discloses said detecting arrangement is adapted to provide an interception of a call to an operating system halting routine or exception handler (Fig. 7, element 701).

Art Unit: 2113

As per claim 29, Klemm discloses said detecting arrangement is adapted to

automatically inspect at least one aspect relating to the operating system (Fig. 8).

As per claim 30, Klemm discloses said detecting arrangement is adapted to automatically inspect at least one of: main memory; a kernel stack; process stacks; a state of all running threads; an amount of pageable memory used; an amount of pageable memory free for use; an amount of total pageable memory in the system; an amount of total pageable memory available to the operating system kernel; an amount of non-pageable memory used; an amount of Non-pageable memory free for use; an amount of total non-pageable memory in the system; an amount of total non-pageable memory available to the operating system kernel; a number of system page table entries used; a number of system page table entries available for use; an amount of virtual memory allocated to a system page table; a size of a system cache; a size of a page cache; a size of a file cache; an amount of space available in a system cache; an amount of space available in a page cache; an amount of space available in a file cache; a size of a system working set; a number of system buffers available; page sizes; a number of network connections established; utilization of one or more central processing units; a number of threads allocated; a percentage of time spent in a kernel; a number of system interrupts per unit time; a number of page faults per unit time; a number of page faults in a system cache per unit time; a number of paged pool allocations per unit time; a number of non-paged pool allocations per unit time; a length of look-aside lists; a number of open file descriptors; an amount of free space on a disk

or disks; a percentage of time spent at interrupt level; a number of device drivers that are loaded; status of loaded device drivers; a number of outstanding I/O requests for device drivers; a state of devices attached to the system (Fig. 3 and 8) and (col. 5-6).

As per claim 33, Klemm discloses said detecting arrangement is adapted to perform automatic inspecting via software (Fig. 8).

As per claim 34, Klemm discloses said arrangement for determining a cause is adapted to identify at least one faulty component (Fig. 7).

As per claim 35, Klemm discloses said analyzing arrangement provides input into said arrangement for determining a cause (Fig. 7, elements 703 and 704).

As per claim 36, Klemm discloses external information provides input into said arrangement for determining a cause (Fig. 7, elements 703 and 704).

As per claim 37, Klemm discloses said arrangement for applying a solution is adapted to effect one or more changes or updates in at least one of: device driver software, operating system code, and firmware (Fig. 7, element 707).

Art Unit: 2113

As per claim 38, Klemm discloses said arrangement for effecting one or more changes or updates is adapted to deactivate faulty software (Fig. 7, element 706).

As per claim 39, Klemm discloses said arrangement for providing a resolution test comprises monitoring a new component during a trial period (Fig. 5).

As per claim 40, Klemm discloses the trial period is over a finite period of time (col. 4, lines 8-25).

As per claim 41, Klemm discloses said arrangement for providing a resolution test is adapted to report the status of the new component subsequent to the trial period (Fig. 5).

As per claim 42, Klemm discloses at least one of the following is repeated upon determination of a negative status of the new component (Fig. 7): detecting a system fault (Fig. 7, element 701) analyzing the system fault (Fig. 7, elements 702 and 703) determining a cause of the system fault (Fig. 7, elements 702 and 703) determining a solution (Fig. 7, element 704) and applying a solution (Fig. 7, element 707) and providing a resolution test (Fig. 7, element 701).

As per claim 43, Klemm discloses a program storage device readable by machine, tangibly embodying a program of instructions executable by the machine to

perform method steps for providing automatic recovery from operating system faults, said method comprising the steps of: detecting a system fault (Fig. 7, element 701) analyzing the system fault (Fig. 7, elements 702 and 703) determining a cause of the system fault (Fig. 7, elements 702 and 703) determining a solution (Fig. 7, element 704) and applying a solution (Fig. 7, element 707).

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

- 1. Determining the scope and contents of the prior art.
- 2. Ascertaining the differences between the prior art and the claims at issue.
- 3. Resolving the level of ordinary skill in the pertinent art.
- 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claims 11-12, and 31-32 are rejected under 35 U.S.C. 103(a) as being unpatentable over Klemm et al. (U.S. Patent No. 6,457,142) in view of Chandiramani et al. (U.S. Patent No. 6,691,250).

Art Unit: 2113

As per claim 11, Klemm fails to explicitly disclose memory corruption.

Chandiramani teaches:

of automatically inspecting comprises determining a degree of memory corruption (col. 7, lines 39-52).

It would have been obvious to one of ordinary skill in the art at the time the invention to use the method of supervising target application program of Klemm et al.'s in combination with the fault handling process for enabling recovery, diagnosis, and self-testing of computer systems of Chandiramani et al. to reliably recover from system failures.

ordinary skill in the art at the time the invention would have been motivated to make the combination because Klemm et al. discloses performance monitoring and fault tolerance for application programs (col. 1, lines 29-37) and (Figs. 7 and 8).

Chandiramani et al. discloses a fault handling process with diagnoses and recovery for system faults (col. 5, lines 6-23) and (Figs. 1, 3A-B).

As per claim 12, Klemm fails to explicitly disclose manual fault resolution.

Chandiramani teaches:

manual fault resolution is prompted if memory corruption is detected (Fig. 3B, element 316) and (col. 7, lines 39-52).

As per claim 31, Klemm fails to explicitly disclose memory corruption.

Chandiramani teaches:

detecting arrangement is adapted to determine a degree of memory corruption (col. 7, lines 39-52).

As per claim 32, Klemm fails to explicitly disclose manual fault resolution.

Chandiramani teaches:

manual fault resolution is prompted if memory corruption is detected (Fig. 3B, element 316) and (col. 7, lines 39-52).

Response to Arguments

Applicant's arguments filed June 22, 2007 have been fully considered but they are not persuasive.

As per claims 23-42, which stand rejected under 35 U.S.C. 101, the Applicants argue that the claims as filed are directed to statutory subject matter. The Examiner respectfully disagrees.

Applicants have cited the specification as a basis of their argument (*see Remarks, page 12*), "...page 16-17 of the specification regarding implementation of the present invention ("it is to be understood that the invention may be implemented in hardware, software, or a combination of both")."

The Examiner states that claim 23 does not include any limitations of a hardware arrangement. Further noting claim 33, a dependent claim, which recites, "wherein said detecting arrangement is adapted to perform automatic inspecting via software."

In light of the specification, it is apparent that the claimed limitation of "an arrangement" is directed to an arrangement of software or computer programs/codes, i.e., the descriptions or expressions of the programs are not physical "things." They are

neither computer components nor statutory processes, as they are not "acts" being performed.

Page 15

In contrast, a claimed computer-readable medium encoded with a computer program executable by the machine to perform method steps is a computer element which defines structural and functional interrelationships between the computer program and the rest of the computer which permit the computer program's functionality to be realized, and is thus statutory. Therefore the Examiner suggests amending claim 23 as described above in order to overcome the 35 U.S.C. 101 rejections.

As per claims 1, 23, and 46, the Applicants argue that (see Remarks, page 13) "Klemm et al. clearly falls short of present invention (as defined by the independent claims) in that, inter alia, it does not teach analyzing the system fault; determining a cause of the system fault; determining a solution; and applying a solution. Klemm et al. merely restarts or terminates an offending thread." The Examiner respectfully disagrees and states that to the contrary, Klemm et al. does not "merely" restart or terminate an offending thread when applying a solution. Further details are provided below.

The Examiner would like to point out to column 6, lines 11-23, wherein Klemm et al. discloses "In addition to more fined-grained problem detection, JAS can also apply more fine-grained problem solution strategies, for example, as follows: make a complex decision about whether to take any action and what action to take based on the exact nature of the problem and based on an optional user-supplied policy; execute actions in addition to program-specified exception handlers when exceptions

are thrown; suspend additional thread creation if the number of threads has reached a user-specified threshold; **reset variable values** if a problem has been detected and variable value changes might **lead to a partial or complete solution of the detected problem**." And further Klemm et al. discloses "The event log allows a user **to pinpoint the nature of the detected problem** and the time in milliseconds and location in the application of the problem occurrence" (col. 6, line 67 through col. 7, lines 1-3).

It is apparent that using an event log to pinpoint the nature of the detected problem reads on the claimed limitations of "analyzing the system fault; determining a cause of the system fault" as recited in the above claims. Furthermore, making a decision on what action to take based on the exact nature of the problem and based on an optional user-supplied policy, and changing variable values, which provide a partial or complete solution of the detected problem, read on the claimed limitations of "determining a solution; and applying a solution" as recited in the above claims. Therefore Klemm et al. clearly teaches the above limitations with respect to claims 1, 23, and 46.

As per claims 11-12 and 31-32, the Applicants argue that (see Remarks, page 14), "A review of the cited language shows that while the language indicates memory corruption could cause a fault, there is no teaching of manually addressing such corruption. In fact, the word "manual" does not appear within the cited language." The Examiner respectfully states that although the word "manual" does not appear within the

cited language, Chandiramani teaches of installing a fault-handling machine by a user (Fig. 3B, element 316).

Chandiramani further discloses, "These fault handlers can be installed by the entity controlling the target system. The handlers can handle specific problems that are better known to the operators of the target system than to the virtual machine. The handlers can be seen as methods that are tailored to a specific type of problem and are installed by the user, i.e., they are user plug-ins. They allow the virtual machine to be extensible and to fit the needs of the user, who can be far more familiar with the type of problems that may be encountered, and allows for overrides by the user." (col. 10, lines 45-54). Installing the fault handler instances and allowing overrides by the user (i.e. manual fault resolution) reads on the claimed limitation of "manual fault resolution" as recited in claims 12 and 32.

Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1 .136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of

Application/Control Number: 10/788,958 Page 18

Art Unit: 2113

the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Elmira Mehrmanesh whose telephone number is (571) 272-5531. The examiner can normally be reached on 9-5 M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Robert W. Beausoliel can be reached on (571) 272-3645. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
